### ABSTRACT

In the modern healthcare industry, the efficient management of patients and medical data is crucial. Traditional methods of handling such information are often cumbersome and time-consuming. There is a high demand for cost-effective and efficient Healthcare Information Management Systems (HIMS) that can streamline these processes. In this project, we aim to develop a comprehensive HIMS application to assist healthcare institutions in efficiently managing their data. The HIMS application can be utilized by hospitals, clinics, and healthcare centers to manage various data records including those of patients and their medical history within the facility. Beyond the fundamental DBMS functionalities such as addition, deletion and update, the application includes other useful features to enhance operational efficiency and data management. Additionally, the system incorporates data visualization capabilities to support research activities, enabling healthcare providers to analyze and interpret data effectively.
